

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

1. (Cancelled)
2. (Cancelled)
3. (Currently Amended) The method according to claim [[1]] 14, wherein an insulating film is formed on the substrate.
4. (Cancelled)
5. (Currently Amended) The method according to claim [[1]] 14, wherein the sacrificial layer pattern is formed in a part at which the lower and upper electrodes intersect.
6. (Currently Amended) The method according to claim [[1]] 14, wherein the sacrificial layer pattern is formed of an organic material, an oxide film or metal, which has a selective etching characteristic with the substrate, the sacrificial layer pattern being formed in a nano-meter thickness.
7. (Original) The method according to claim 6, wherein the sacrificial layer pattern is formed of the organic material, the oxide film or the metal of a multilayer structure having different etching selection ratios.

8. (Currently Amended) The method according to claim [[1]] 14, wherein the nano gap is formed so that vertical and horizontal distances thereof are asymmetric, the horizontal distance being larger than the vertical distance.

9. (Currently Amended) The method according to claim [[1]] 14, wherein the conductive organic molecules are adsorbed while the substrate is immersed in a solution in which the conductive organic molecules are dissolved.

10. (Original) The method according to claim 9, wherein an electric field is applied between the lower electrode and the upper electrode on the substrate.

11. (Original) The method according to claim 9, wherein the solution is stirred or heated.

12. (Currently Amended) The method according to claim [[1]] 14, wherein when the conductive organic molecules are adsorbed, a current flowing through the lower electrode and the upper electrode is sensed so that whether and how much to adsorb is observed.

13. (Currently Amended) The method according to claim [[1]] 14, further comprising a step of passivating an exterior with the insulating film after the step (e).

14. (New) A method for manufacturing an organic molecular device comprising the steps of:

a) providing a substrate of a resistive insulating material having an upper surface and forming a lower electrode on the upper surface of the substrate;

b) forming a predetermined size of a sacrificial layer pattern on an entire upper surface of the substrate including the lower electrode;

c) using a photo etching technique to remove a portion of the sacrificial layer excluding a predetermined area covering the lower electrode so that the sacrificial layer surrounds the lower electrode;

d) covering the entire remaining surface from step c including the sacrificial layer surrounding the lower electrode with a polymer and forming a polymer pattern with a line width of 50nm by an electron beam etching technique to expose the sacrificial layer and the substrate on which the lower electrode is formed;

e) forming an upper electrode by depositing metal on an entire upper surface from step d and removing metal on the polymer pattern by a lift-off process so that an upper electrode is formed and the sacrificial layer surrounds the lower electrode and is on an exposed portion of the insulator;

f) removing the sacrificial layer so that a nanogap is formed between the upper electrode and the lower electrode; and

g) adsorbing conductive organic molecules between the upper electrode and the lower electrode.
